PROFESSIONAL SUMMARY

Computer Science student with hands-on experience building full-stack web applications using the MERN stack. Comfortable working across React, Node.js, Express, and MongoDB — implementing REST APIs, authentication flows, and database logic independently. Focused on understanding how systems work by building and debugging projects from scratch.

TECHNICAL SKILLS

Languages & Frontend: JavaScript (ES6+), HTML5, CSS3, React.js, Tailwind CSS, Context API, React Router

Backend: Node.js, Express.js, REST APIs, MVC Architecture

Database: MongoDB, Mongoose

Auth & Security: JWT, Google OAuth 2.0, Protected Routes

Real-Time & AI: Socket.IO, Gemini API Integration

Tools & Platforms: Git, GitHub, Postman, Vercel, Render, Cloudinary, npm, VS Code

PROJECTS

SpendWise AI [Live Demo](#)

React.js · Node.js · Express.js · MongoDB · Tailwind CSS

- Built an AI-powered spend auditing platform that lets startups input their AI tool subscriptions and receive structured cost-saving recommendations.
- Designed MongoDB schemas and Express routes to store user-submitted subscription data and generate personalized savings reports.
- Integrated AI-generated summaries into the reporting layer, surfacing actionable insights from parsed spend inputs.
- Built a responsive dashboard with shareable audit reports and a lead capture form with server-side validation and storage.
- Deployed frontend on Vercel with a decoupled Express/MongoDB backend on Render.

Conversa AI [Live Demo](#)

React.js · Node.js · Express.js · MongoDB · Gemini API

- Built a full-stack AI chat application end-to-end — from Gemini API integration and Express routing to MongoDB persistence and React frontend rendering.
- Implemented persistent chat history in MongoDB, allowing users to resume conversations across sessions after logging back in.
- Added Markdown and syntax-highlighted code block rendering on the frontend to improve readability of technical AI responses.
- Managed global application state with React Context API, keeping component logic clean and reducing prop-drilling.
- Deployed using a split frontend/backend setup: React on Vercel, Express server on Render.

HabitBond [Live Demo](#)

React.js · Node.js · Express.js · MongoDB · Socket.IO · JWT · Google OAuth 2.0

- Built backend API endpoints and MongoDB schemas for habit tracking, including streak calculation logic handled entirely server-side.
- Implemented JWT-based authentication and Google OAuth 2.0 with protected routes enforced on both frontend and backend.
- Integrated Socket.IO to push real-time habit status updates from server to client without page refresh.
- Set up Cloudinary for profile image uploads, handling multipart form data on the Express side.
- Currently revisiting and independently rebuilding core backend and auth logic to deepen understanding of the implementation.

EDUCATION

BSc Computer Science — SIES College, Mumbai | Expected Graduation: 2027

CERTIFICATIONS

IBM Web Development Fundamentals — IBM / Coursera
